PROFILE

For 5 years I've built home and building automation apps: panels with 1 GB of RAM, apps that keep working without internet, and a platform with more than 10,000 devices in the field. For the past year I've focused on applied AI, connecting language models and agents to real products. I came from Agricultural Engineering and project management, so I design software starting from the process, not the code.

EXPERIENCE

Software Engineer & AI Engineer · Smartek Life — Sep 2024 - Present · Goiânia, GO

I work end to end on the company's building and home automation platform, from the apps to the server and the data, with more than 10,000 devices in the field. I map how sales, operations, support and inventory work, turn that into software, and help decide where AI is worth the cost. I mentor a junior developer and an intern.

- **Every failure traced back to its source.** I built tools that show exactly where and why something broke, across the app, the server and every device. Finding the root cause went from days to minutes, and errors in production fell 35%.
- **In-house CRM replacing a fragile tool chain.** I replaced the chain with an in-house CRM connected to Meta, Pipedrive and WhatsApp, which fills in lead data automatically. No single failure can stop lead capture anymore, and the cost of sales and automation tools fell 70%.
- **Homes that understand voice commands.** I built GPT-powered voice control whose context can change without an app update, and shipped the Amazon Alexa integration. It interprets 95% of commands correctly, and voice control now works beyond our own app.
- **An ERP four departments use every day.** I rebuilt it as a system tailored to how the company actually works. Four departments now use it every day: inventory, operations, support and sales.

Software Engineer · Smartek Life — Oct 2022 - Sep 2024 · Goiânia, GO

I built the home automation app for iPhone and Android from a single codebase (React Native), plus the layer that lets the app talk to the devices installed in each home. I also set shared code standards for the team.

- **A slow panel made fast, no new hardware.** I measured where the time went and rebuilt how screens load and render. Screens now open in under 400 ms, on the same hardware.
- **A house that responds even offline.** I built control for 10+ device types, including any infrared or radio remote, working online and over the home's own network. The house keeps responding even with no internet.
- **Lighting control, the most-used feature.** I built the platform's lighting integration and control. Customers set brightness and color from the app, on LED, dimmer and RGB lights.

Software Engineer · Supera Inovação em Tecnologia — Oct 2021 - Oct 2022 · Goiânia, GO

At a software house, I shipped four apps for different clients, each with its own business, technology and rules, so I learned to adapt fast. I worked on both the screens and the server behind them, about 70% of the time on the screens.

- **Field data synced without losing records.** I built the wireless sync between the sensors and the mobile app, controlling speed, data integrity and reconnection. A sync can stop and resume without losing or duplicating records.
- **Weather data turned into irrigation advice.** I developed the mobile app for an agritech startup. The app turned weather monitoring into irrigation recommendations.
- **A customer engagement app for retail.** I delivered the app end to end, from the screens to the server behind them. The client got contact management and promotional campaigns in one app.

Software Project Manager · Bristom — May 2021 - Oct 2022 · Goiânia, GO

My first job in tech: I managed software projects at an agritech startup, turning what growers needed into requirements for the development team. This is where I learned to code. Supera later absorbed the operation,

and I kept running Bristom's projects from there.

From growers' problems to software requirements. I sat with them, turned their needs into requirements and scope, and carried projects from discovery to delivery. That's where I learned to start from the process, not the code.

Leading the development team. I coordinated the development team across the whole project lifecycle. I learned what makes an estimate realistic and a handoff clean.

From project manager to engineer. I started writing code myself: React web apps and React Native mobile apps, helping shape their design. That move took me into software engineering, and it's why I still design software from the process backwards.

PROJECTS
